1) ABSTRACT

In this project, it is aimed to deep learning based marble classification. Using data which included marble images to train and test. This data has 516 different marble images. In this project this data has been trained with different deep learning algorithms in Matlab and Python environment. 12 different models trained with Matlab and 6 different model trained in Python which 5 are common. Models compared in each other and also with Python and Matlab.

2) STAGES OF THE PROJECT

2.1) Dataset

In this project used dataset which has 516 different marble images with 5 different classes as beige-blue dark, beige- emp, beige-gri, trv-classic, trv-noce.

Figure.1 Sample marble images from dataset

2.2) Matlab

In this project firstly used Matlab Deep Learning Toolbox for understanding deep learning structure and faster results. 12 different models trained with the marble data which are Xception, GoggleNet, Resnet18, ResNet50, Resnet101, Alexnet, DarkNet19, DarkNet53, Vgg16, Vgg19, Inception, MobileNet.

In matlab firstly has been loaded marble images which shown below.

```
%LOAD DATA
digitDatasetPath = fullfile('D:\_MASAÜSTÜ\DATASET_MARBLE');
imds = imageDatastore(digitDatasetPath, ...
    'IncludeSubfolders',true,'LabelSource','foldernames');
```

Figure.2 A part of code (Matlab)

Then the data was splitted with 0.3 ratio to test and others train.

```
%Split the data into 70% training and 30% test data
[imdsTrain,imdsValidation] = splitEachLabel(imds,0.7,'randomized');
```

Figure.3 A part of code (Matlab)

Thirdly, using Matlab Deep Network Designer Toolbox created the layers and weights.

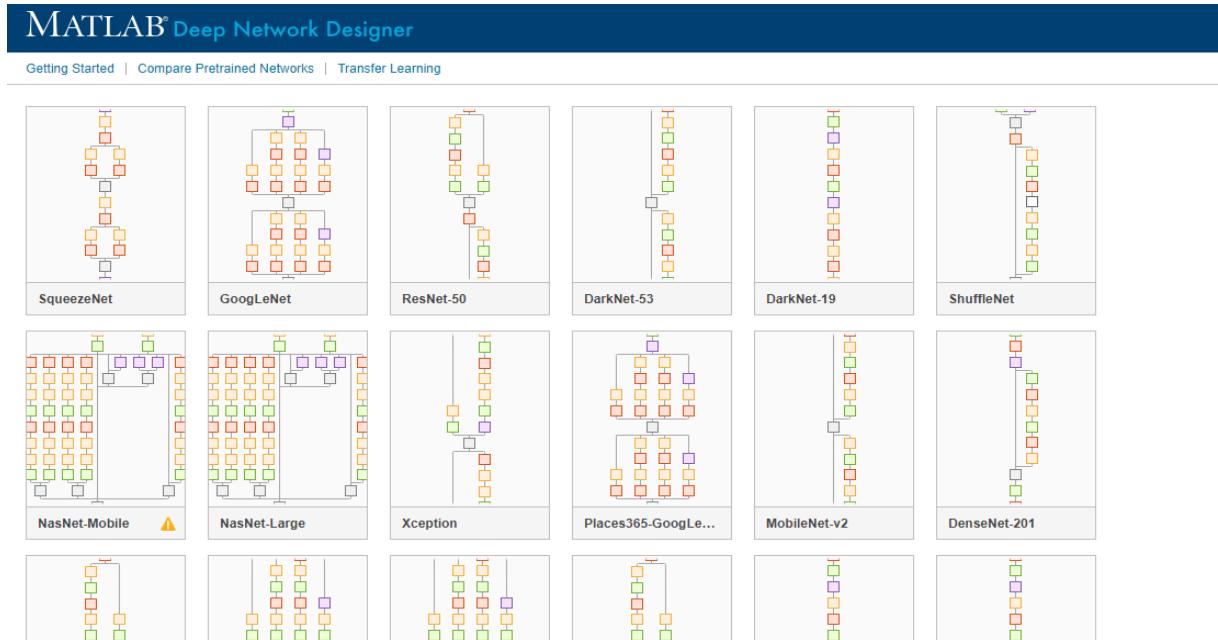

Figure.4 Interface of Deep Network Designer

```

tempLayers = [
    imageInputLayer([224 224 3],"Name","Input_gpu_0\data_0","Normalization","zscore")
    convolution2dLayer([3 3],24,"Name","node_1","Padding",[1 1 1 1],"Stride",[2 2])
    batchNormalizationLayer("Name","node_2")
    reluLayer("Name","node_3")
    maxPooling2dLayer([3 3],"Name","node_4","Padding",[1 1 1 1],"Stride",[2 2]));
lgraph = addLayers(lgraph,tempLayers);

tempLayers = [
    groupedConvolution2dLayer([1 1],28,4,"Name","node_5")
    batchNormalizationLayer("Name","node_6")
    reluLayer("Name","node_7")
    helperNnetShufflenetLayerChannelShufflingLayer("shuffle_8to10",4,"in","out")
    groupedConvolution2dLayer([3 3],1,112,"Name","node_11","Padding",[1 1 1 1],"Stride",[2 2])
    batchNormalizationLayer("Name","node_12")
    groupedConvolution2dLayer([1 1],28,4,"Name","node_13")
    batchNormalizationLayer("Name","node_14")];

```

Figure.5 Sample code of created with Toolbox

After train ended the confussion matrix and random predict images created then trained model was saved.

```

%Confusion Matrix
plotconfusion(imdsValidation.Labels,YPred)

%Predict random images
idx = randperm(numel(imdsValidation.Files),16);
figure
for i = 1:16
    subplot(4,4,i)
    I = readimage(imdsValidation,idx(i));
    imshow(I)
    label = YPred(idx(i));
    title(string(label) + ", " + num2str(100*max(scores(idx(i),:)),3) + "%");
end

%Save Model
DenseNet_Model_1 = net;
save DenseNet_Model_1

```

2.3) Python

After all 12 models trained in Matlab part result was noted. And some models which gives over the overall accucacy levels coded on Anaconda Jupyter Notebook which are Vgg16, Vgg19, Xception, Inception, MobileNet and Resnet50. In this python part as same Matlab as started with imported libraries and loaded data.

```
data_dir = r'D:\_MASAÜSTÜ\2020 _BAHAR\Deep learning\DATA_299x299'

image_generator = ImageDataGenerator(rescale=1/255, validation_split=0.2)

train_data_dir = image_generator.flow_from_directory(batch_size=32,
                                                     |                                                 directory=data_dir,
                                                       shuffle=True,
                                                       target_size=(224, 224),
                                                       subset="training",
                                                       class_mode='categorical')

validation_dir = image_generator.flow_from_directory(batch_size=32,
                                                      |                                                 directory=data_dir,
                                                        shuffle=True,
                                                        target_size=(224, 224),
                                                        subset="validation",
                                                        class_mode='categorical')
```

Figure.47 A part of code from python (loaded data)

After loaded 516 marble images to the system these are split with 0.2 ratio. So 414 marble images used for train and other 102 marble images used for test.

```
model = tf.keras.Sequential(
    [
        tf.keras.layers.Conv2D(32, (3, 3), padding='same', kernel_initializer='he_normal', input_shape=(224,
        tf.keras.layers.Activation('elu'),
        tf.keras.layers.BatchNormalization(),
        tf.keras.layers.Conv2D(32, (3, 3), padding='same', kernel_initializer='he_normal', input_shape=(224,
        tf.keras.layers.Activation('elu'),
        tf.keras.layers.BatchNormalization(),
        tf.keras.layers.MaxPooling2D(pool_size=(2, 2)),
        tf.keras.layers.Dropout(0.2),
        tf.keras.layers.Conv2D(64, (3, 3), activation='elu', padding='same'),
        tf.keras.layers.BatchNormalization(),
        tf.keras.layers.Conv2D(64, (3, 3), activation='elu', padding='same', kernel_initializer='he_norm
        tf.keras.layers.BatchNormalization(),
        tf.keras.layers.MaxPooling2D(pool_size=(2, 2)),
        tf.keras.layers.Dropout(0.2),
        tf.keras.layers.Conv2D(128, (3, 3), activation='elu', padding='same', kernel_initializer='he_n
        tf.keras.layers.BatchNormalization(),
        tf.keras.layers.Conv2D(128, (3, 3), activation='elu', padding='same', kernel_initializer='he_i
        tf.keras.layers.BatchNormalization(),
```

Figure.48 Model part of code with 'elu' activation function

```

earlystop = tf.keras.callbacks.EarlyStopping(monitor='val_loss',
                                             min_delta=0,
                                             patience=3,
                                             verbose=1,
                                             restore_best_weights=True
)

```

Figure.49 Early Stop Code

Early stopping is a technique used to terminate the training before overfitting occurs.

```

reduce_lr = tf.keras.callbacks.ReduceLROnPlateau(monitor='val_loss',
                                                 factor=0.2,
                                                 patience=3,
                                                 verbose=1,
                                                 min_delta=0.0001)

```

Figure.50 Reduce Learning Rate Code

Reduce learning rate when a metric has stopped improving. Then coded for the Show train and test result as a accuracy.

```

import matplotlib.pyplot as plt
print(history.history.keys())
plt.plot(history.history['accuracy'])
plt.plot(history.history['val_accuracy'])
plt.title('model accuracy')
plt.ylabel('accuracy')
plt.xlabel('epoch')

3) CONCLUSION

According to the results obtained in the project 12 different model in Matlab and 5 different model trained in Python. In a result table shown in below most of the model result almost same in Python and Matlab.

Model Name	Matlab (%)	Python (%)
Xception	87	77
Vgg16	78	92
Vgg19	77	35
Resnet50	72	71
Inception	71	69

Figure.76 Result Accuracy Table

After analyzed table Xception model best fit for marble data in matlab and Vgg16 model best fit for marble data in python. But somehow Vgg19 never reached to over of 0.35 accuracy ratio.

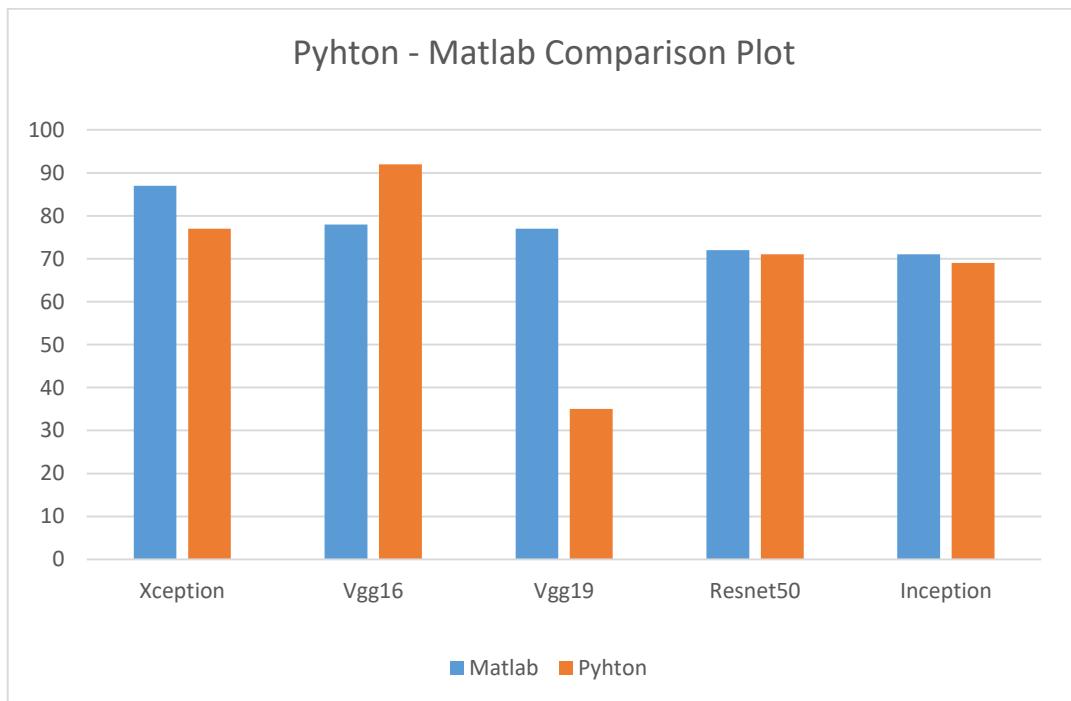

Figure.77 Result Accuracy Plot
